detectable in myocardium.

Thourston: Down-regulated in some cancer cell lines. Eplin-alpha is induced by serum. Eplin-beta is constitutively expressed.

SIMILARITY: Contains 1 LiM zinc-binding domain.

CAUTION: Ref. 4 (BAA91120) sequence differs from that shown due to a frameshift in position 697.

CAUTION: Ref. 6 sequence differs from that shown due to captilons 365 and 662. Isoid=Q9UHB6-3; Sequence-vSP\_003117;
Note=No experimental confirmation available;
Note SPECIFICITY: Highly expressed in placenta, kidney,
TISSUE SPECIFICITY: Highly expressed in placenta, kidney,
pancreas, prostate, ovary, spleen and heart. Also detected in
lung, liver, brain, skeletal muscle, thymus, testis and intestine.
Not detected in leukocytes. Eplin-beta levels are generally very
low. Eplin-alpha is abundant in epithelial cells from mammary
gland, prostate and in normal oral keratinocytes. Levels are low
in a ortic endothalial cells and dermal fibroblasts, and not Event=Alternative splicing, Named isoforms=3; Comment=Experimental confirmation may be lacking for some IsoId=09UHB6-2; Sequence=VSP\_003116; IsoId=Q9UHB6-1; Sequence=Displayed; isoforms; Name=Alpha; Name=Beta;

"Nucleotide sequence and predicted functions of the entire
Sinorhizobium meliloti pSymā megaplasmid.";
                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CTNAG, CAUSES SPECIFIC METHYLATION ON C-1 ON BOTH STRANDS, AND PROTECTS THE DNA FROM CLEAVAGE BY THE DDE1 ENDONUCLEASE.

-: CATALYTIC ACTIVITY: S-adenosyl-L-methionine + DNA cytosine = S-adenosyl-L-homocysteine + DNA 5-methyloycosine.

-: SIMILARITY: BELONGS TO THE C5-METHYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-OCT-2001 (Rel. 40, Created)

Proc. Natl. Acad. Sci. U.S.A. 98:9883-9888 (2001).

-!- FUNCTION: Converts seryl-tRNA(Sec UCA) to selenocysteinyl-tRNA(Sec UCA) during selenoprotein biosynthesis (By similarity).

-!- CATALYIT CACTIVIT: L-seryl-tRNA(Sec) + selenophosphate = L-
selenocysteinyl-tRNA(Sec) + phosphate.

-!- COFACTOR: Pyridoxal phosphate (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: BELONGS TO THE SELA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gallus gallus (Chicken).

NACULE 392:353-358 (1998).

-I FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-STRANDED DNA IN ATP-DEPENDENT WANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATENANES AND KNOTTED RINGS.

-I CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.

-I SUBUNIT: MADE UP OF TWO CHAINS. THE A CHAIN IS RESPONSIBLE FOR DNA BRBAKAGE AND REJOINING; THE B CHAIN CATALYZES ATP HYDROLYSIS. THE

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3399-3402) similarity depect (1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions, Sequences that are not

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5105512

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                      Lipid-associated proteins (LIPAP) can be used for treating or preventing disorders associated with decreased expression of LIPAP, proventing disorders associated with decreased expression of LIPAP, and to raise for screening for agonists or antagonists of LIPAP are useful specific antibodies. Antagonists and antagonists of LIPAP are useful LIPAP, e.g. cardiovascular, neurological and gastrointestinal LIPAP, e.g. cardiovascular, neurological and gastrointestinal diseases and disorders of lipid metabolism. Fragments of the nucleic sequences, in hybridization and/or amplification of full length coding diagnosis or monitoring. Nucleocides encoding LIPAP are used for compounds that specifically modify LIPAP are used for therapeutic antisense, triplex-forming, or ribozyme as source of for recombinant production of LiPAP, in gene therapy, as a source of the respectic antisense, triplex-forming, or ribozyme agents and for therapeutic antisense, triplex-forming, or ribozyme agents and for antimorial antigonists, in competitive drug screens and for affinity purification of natural LIPAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

```
This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of
                                                                                                                                                                                                                                            3605

The present sequence encodes a human Eplin (epithelial protein lost in neoplasm)-beta isoform. The specification also describes Eplin-alpha.

C EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. BPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to used in screening assays to detect molecules that specifically bind to specific acids, proteins or derivatives and thus have potential use EPLIN nucleic acids, proteins or derivatives and thus have potential use companist or antagonist of EPLIN, in particular molecules that affect as agonist or antagonist of EPLIN, in particular molecules that acompounds for drug cell proliferation. Thus the assays are useful for detecting a development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polymucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over consecute of a cell proliferative disorder associated with EPLIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CTCAGGTCACCTCCTGAAGCCCTCGTTCAGGGTCGATATCCCCACATCAAGGACGGTGAG 583

The present sequence encodes a human EPLIN (epithelial protein lost in neoplasm) -alpha isoform. The specification also describes EPLIN-beta.

CC EPLIN is a tumour suppressor protein, whose expression is altered in much type. EPLIN modeler acids and proteins are used in screening assays to detect molecules that specifically bind to complete common human tumour types. EPLIN mucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect of as agonist or antagonist of EPLIN, in particular molecules that affect with potential utility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN. 361 218 278 421 481 neoplasm)" 302 AACACCGAAAATCTCTCCCAGCACTTTAGAAAGGGGACCCTGACTGTTAAAGAAGAAG GAGATTAGGCACAGAGCAGACCATCCTCCTGCTGAAGTGACAAGCCACGCTGCTTCTGGA TOCGAGAACCCAGGGCTGGGAGCAGAGTCTCACACAGACTCTTACGGAACAGCAGCACT diagnostic, cell 10; Gaps EPLIN (epithelial protein lost in neoplasm)-alpha isoform DNA Human; EPLIN; epithelial protein lost in neoplasm; EPLIN-alpha; EPLIN-beta; tumour suppressor; tumour; cell proliferative disorder; Score 3324.4; DB 22; Length 3543; Pred. The invention relates to human nucleic acids (AALS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptide are useful immunosuppressant and cytostatic activity. The polymucleotides are useful for gene therapy. A composition containing a polypeptide or polynucleotide in gene therapy. A composition containing a polypeptide or polynucleotide contains and the set of the peripheral nervous cystem, such as peripheral nervous injuries, peripheral nervous cystem diseases, such as localised neuropathies and central nervous system diseases, such as letteral sclerosis, and Shy Drager Syndrome. Other uses include the activity, chemotactic/chemotinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and contains and contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ω
                                                                                                                          gene therapy; cancer;

(HYSE-) HYSEQ INC

Tand Liu C, Drmanac RT,

The invention relates to isolated polynucleotide (I) and composed polymerase chain reaction (PCR) primers, oligomers, and for chromosome colymerase chain reaction (PCR) primers, oligomers, and for chromosome colymerase chain reaction (PCR) primers, oligomers, and for chromosome composed mapping, and in reaccombinant production of (II). The colymcicotides are also used in diagnostics as expressed sequence tags polymucicotides are also used in diagnostics are therapy techniques cor restore normal activity of (II) or to treat disease states involving contracting a polypeptide in tissue, as molecular weight markers and as (II) is useful for generating antibodies against it, detecting or consupplement. (II) and its binding pattners are useful for treating a food supplement. (II) and its binding pattners are useful for treating in medical consistence and protein expression or biological activity. Cresponsible for genetic disorders in and (II) are useful for treating cresponsible for genetic disorders or other traits to assess biodiversity cresponsible for genetic disorders or other traits to assess biodiversity cand to produce other types of data and products dependent on DNA and conditions in colding sequences. AAS4197-AAS45454 represent novel human amino acid sequences. AAS4197-AAS45454 represent novel human creating coding sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO contraction. 75.3%; Score 2789.2; DB 23; Length 3465; illarity 94.3%; Pred. No. 0; Conservative 0; Mismatches 123; Indels 73; New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity Sequence 3465 BP; 1112 A; 706 C; 773 G; 874 T; 0 other; Claim 1; SEQ ID No 8550; 103pp; English 2001-639362/73

The invention relates to 592 polynucleotides which have been derived from a variety of human tissue sources and which encode novel secreted a variety of human tissue sources and which encode novel secreted compared to the polynucleotides can be used as probes for the proteins. The polynucleotides and solation of full length cDNA and genomic DNA. The compared compared to the treatment of various immune deficiencies. The proteins are useful in the treatment of various immune deficiencies. The proteins are useful in the treatment of various immune deficiencies and disorders such as viral infections, bacterial infections, fungal infections, autoimmune disorders (e.g. rheumatorid arthritis, multiple infections, autoimmune thyroiditis and diabetes) and allergic reactions sclerosis, autoimmune thyroiditis and diabetes) and allergic reactions conditions (e.g. Alzheimer's disease, Parkhinson's neurodegenerative diseases (e.g. Alzheimer's disease, Parkhinson's conditions (e.g. Alzheimer's disease) and tumours. They are also inflammatory disorders (e.g. Crohn's disease) and tumours. They are also useful for tissue regeneration, for wound healing and in the treatment of burns, incisions and ulcers. The proteins are also useful for regulating burns, incisions and ulcers. The proteins are also useful for regulating wyeloid or lymphoid cell deficiencies. Sequences ABK34863-ABK35454 represent polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                        Five hundred and ninety two polynucleotides derived from a variety of human tissue sources which encode secreted proteins, useful for treating immune deficiencies and disorders such as autoimmune disorders
                                                                                                                                                                                                  RJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or activity against breast cancer in the sequences can be used in sense or therapy to treat breast cancer and for treating illnesses associated with fat metabolism. AA233541-233610 represent expressed sequence tags described in the method of the invention.

The polynucleotide sequences given in AAC59449 to AAC59497 encode the human secreted proteins given in AAB34092 to AAB34141 to human secreted proteins given in the exemplification of the present homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissue and cells the genes are expressed in. Examples of activities include: antiarthritic; immunosuppressive; antirheumatic; antipolificative; antiarthritic; immunosuppressive; antirheumatic; antipolificative; antiarthritic; immunosuppressive; antirheumatic; antipolificative; antiarthritic; immunosuppressive; antirheumatic; antipolificative; antiborterial; virucide; fungicide; ophthalmological; neuroprotective; notiopolic; cerebroprotective; notiopolic; erebroprotective; notiopolic; prevent, treat or ameliorate a medical condition in e.g. humans, mice, prevent, treat or ameliorate a medical condition in e.g. humans, mice, prevent, spates, horses, cats, dogs, chickens or sheep. They are also used autoimmune diseases, horses, dogs, chickens or sheep. They are also used pathological condition or susceptibility to a pathological condition. Disorders which are disgnosed or treated include pathological condition. Disorders which are disgnosed or treated include bacteria, viruses and fungi and ocular disorders, infections caused bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to transplantation, for supporting cell culture of primary tissues, to transplantation, for supporting cell culture of primary tissues and in chemoteasies or decrease storage as a food additive or preservative to increase or decrease storage as a food additive or preservative to increase or decrease storage in the exemplification of the present invention.

Compute sequences AAC91479 - AAC91527 represent cDNA encoding human secreted proteins AAB51875 - Sequences AAB51876 - AAB51875 Sequences AAB51876 - AAB51875 Sequences AAB51876 - AAB51875 Sequences AAB51876 - AAB51875 Sequences AAB51876 - AAB51875 Sequences AAB51876 - AAB51877 represent alternative polypeptides encoded by the genes and continuous action sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they are expressed. Examples of their activities include immunosuppressive; ancider in activities include immunosuppressive; ancidered; antibacterial; antibacterial; antibacterial; antibacterial; polymuclectides, antibactorial; and vulnerary. The secreted contrainty, preventing and/or diagnosing diseases and disorders such a proteins, polymuclectides, antibacterial included in the median arthritis, hyperproliferative action areas, rerebrovascular disorders e.g. crebtral isolaemia, anglogenesis, nervous system disorders e.g. Alzheimer's disease. C. e.g. corneal infection ansocial disorders e.g. Alzheimer's disease. C. e.g. corneal infection. The polypeptides can also be used to aid wound contraint infection. The polypeptides can also be used as a food additive or preservative to polypeptides can also be used as a food additive or preservative to polypeptides can also be used as a food additive or preservative to carbonydrate, vitamins, minerals, cofectors and other nutritional components. Oligonuclectides AAC93470 - AAC93478 and other nutritional components. Oligonuclectides AAC93470 - AAC93478 and other and contrains and characterisation of the proteins and cuestion and characterisation of the proteins and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2092

The invention relates to human nucleic acids (AAIS7798-AAI61369) and cthe encoded polypeptides (AAM38642-AAM46213) with noorropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide or polynucleotide as perpheral nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's parkinson's disease, System suppression, cuilisation of the activity, chemosectic/chemoKinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, context of the sequence data for this riviers.
                                                                            cancer;
                                                                       Human, nootropic, immunosuppressant, cytostatic, gene therapy, cancer peripheral nervous system; CNS; Alzheimer's, Parkinson's disease, Huntington's disease, haemostatic, amyotrophic lateral sclerosis, Shy-Orager Syndrome, chemotactic, chemokinetic, thrombolytic, drug screening, arthritis, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ren F, W

The present invention describes primer sets for synthesising 5602 (bill-length cDNAs defined in the specification. Where a primer set comprises: 40 an oligo-dT primer and an oligouncleotide complementary to the complementary strand of a polynucleotide which comprises one of complementary strand of a polynucleotides, or (b) a compination of an oligonucleotide comprises a sequence complementary to the comprise and oligonucleotide comprising a sequence complementary to the squence and an oligonucleotide comprising a sequence complementary to the comprises an oligonucleotide which comprises a 5'-end sequence of an oligonucleotide comprises a 1'-end sequence of complementary to a polynucleotide which comprises a 1'-end sequence of sequence of sequence of comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for AAH13628 and AAH13631 to AAH13632 to AAH13632 represent human cDNA sequences; ABB92446 to AAH13632 represent human cDNA sequences; ABB92446 to AAH13632 represent human cDNA sequences; ABB924246 to AAH13632 represent human cDNA sequences; ABB924246 to AAH13632 represent human cDNA sequences; ABB924246 to AAH13632 represent human cDNA sequences; and AAH13632 represent human cDNA sequences; and AAH13632 represent human cDNA sequences; and AAH13632 represent human cDNA sequences; and AAH13632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ACCTGCGTGGAATGTCAGAAGACAGTCTATCCAATGGAGCGTCTCTTGGCCAACCAGCAG 1360
                                                                                                                                                                                                                                                                                                                                       Ö
The invention relates to a novel human sterol regulatory element binding protein 3 (hSREB-3) expressed in human normal hypothalamic tissue and its coding sequence. Also described is the process for preparing the protein and nucleic acid sequence, and the method for detecting hSREBP-3 nucleic acid sequence and polypeptides. The present sequence represents the coding sequence of human hSREBP-3 as described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AGTOTTTOTGAAAGTTOTCOCOCAAAGCAATGAAGAAGTTTCAGGCACCTGCAAGAGAG

TITLE

Submitted (16-JUL-2001) Yoshihide Hayashizaki, The Institute of Physical and Chemical Research (RIKEN), Laboratory for Genome Exploration Research Group, RIKEN Genomic Sciences Center (GSC), RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokohama, URL: http://genome-gsc.riken.go.jp, Tel:81-45-503-922,

COMMENT

d

cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. Please visit our web site for further details URL:http://genome.gsc.riken.go.jp/ URL:http://fantom.gsc.riken.go.jp/ Location/Qualifiers
